Missing value in a dataset is a very common phenomenon in the reality, yet a big problem in real-life scenarios. Missing Data can also refer to as NA(Not Available) values in pandas. In DataFrame sometimes many datasets simply arrive with missing data, either because it exists and was not collected or it never existed. For example, Suppose during a survey

- Different users may choose not to share their addresses
- There might be a failure in recording the values due to human error.

tbu-wxnq-kfg

Missing values can be handled by deleting the rows or columns having null values. If columns have more than half of the rows as null then the entire column can be dropped. The rows which are having one or more columns values as null can also be dropped.
